

## Class 8. 27/4/2020

**MATTER:** anything that occupies space, has mass, and felt by senses

E.g. table, book, air, water.

Characteristics of matter are underlined in the definitions.

Heat, sound, hate, shadow etc, are not regarded as matter as they don't have mass or can occupy space.

### **STATES OF MATTER**

Solid, liquid, gas (gases and liquids are fluid as they can flow) all these are interconvertible with the change of conditions.

### **Kinetic theory of matter**

- (1) matters are made up of extremely small particles called molecules.
- (2) molecules are in constant rapid random motion.
- (3) they possess kinetic energy.
- (4) molecules attract each other by cohesive or adhesive force.
- (5) kinetic energy increases with increase in temperature.
- (6) as the distance between the molecules increases the force between them decreases.

### **Sublimation**

The process of converting solid directly to vapour on heating and vapour back to solid on cooling without coming to its liquid state. Example naphthalene, ammonium chloride, iodine and camphor.

### **Difference between gas and vapour**

Substance which remain in the gaseous state at its room temperature is called gas, example hydrogen oxygen nitrogen. But those substance which changes its state to gaseous at a particular condition other than room temperature are called vapours. Example water vapour, iodine vapour, Mercury vapour.

### **Law of conservation of mass:**

**Any chemical reaction mass of the reactant is equal to mass of the product.**

VIII

Law of Conservation of mass:-

ie  $\text{mass of the reactant} = \text{mass of the product.}$   
Reactant PRODUCT

$$\text{Mg} = 24, \quad \text{O} = 16$$

Mass of the reactants (ie  $2\text{Mg} + \text{O}_2$ )

$$= 2 \times 24 + 16 \times 2$$

$$= 48 + 32$$

$$= 80 \text{ u/amu}$$

Mass of the product (ie  $2\text{MgO}$ )

$$= 2 \{ 24 + 16 \}$$

$$= 2 \times 40$$

$$= 80 \text{ u/amu}$$

Since, mass of the reactant = Mass of the product

$$\text{ie } 80 = 80 \text{ (u/amu)}$$

So it supports, Law of Conservation  
of mass.

VIII

Law of Conservation of mass:-

ie mass of the reactant = mass of the product.

$$\text{N} = 14; \text{H} = 1 \quad \text{Cl} = 35.5$$

Mass of the reactant i.e.  $\text{NH}_3$  &  $\text{HCl}$

$\text{NH}_3$  = Atomic mass of N  $\times$  no. of times it is present +  $\text{H} \times 3$

$$\begin{aligned} \text{Mass of } \text{NH}_3 &= 14 \times 1 + 1 \times 3 \\ &= 14 + 3 = 17 \text{ u/amu} \end{aligned}$$

Mass of  $\text{HCl}$  = Atomic mass of  $\text{H} \times$  no. of times +  $\text{Cl} \times 1$

$$= 1 \times 1 + 35.5 \times 1$$

$$= 1 + 35.5$$

$$= 36.5$$

So, Mass of the reactant (i.e.  $\text{NH}_3$  &  $\text{HCl}$ )

$$= \text{Mass of } \text{NH}_3 + \text{Mass of } \text{HCl}.$$

$$= 17 + 36.5$$

$$= 53.5 \text{ u/amu.} \checkmark$$

Mass of the Product (i.e.  $\text{NH}_4\text{Cl}$ )

$$= \text{N} \times 1 + \text{H} \times 4 + \text{Cl} \times 1$$

$$= 14 \times 1 + 1 \times 4 + 35.5 \times 1$$

$$= 14 + 4 + 35.5 \Rightarrow 53.5 \text{ u/amu.} \checkmark$$

Mass of the reactant = Mass of the Product (i.e.  $53.5 \text{ u/amu}$ )

$\therefore$  it agrees with the L.O.C of mass.

VIII

### Law of Conservation of mass:-

if mass of the reactant = mass of the product.

Atomic mass of Ca = 40; C = 12 & O = 16.

Mass of the reactant (CaCO<sub>3</sub>)

= Atomic mass of Ca  $\times$  no. of times it is present + C  $\times$  1 + O  $\times$  3

$$= 40 \times 1 + 12 \times 1 + 16 \times 3$$

$$= 40 + 12 + 48$$

$$= 100 \text{ u/amu} \quad (\text{unit is u/atomic mass unit})$$

Mass of the Product

$$\text{i.e. CaO} = \text{Ca} \times 1 + \text{Oxygen} \times 1$$

$$= 40 \times 1 + 16 \times 1$$

$$= 40 + 16$$

$$= 56 \text{ u/amu}$$

$$\& \text{ CO}_2 = \text{C} \times 1 + \text{Oxygen} \times 2$$

$$= 12 \times 1 + 16 \times 2$$

$$= 12 + 32$$

$$= 44 \text{ u/amu}$$

$$\therefore \text{mass of the Product} = \text{Mass of CaO} + \text{Mass of CO}_2$$

$$= 56 + 44$$

$$= 100 \text{ u/amu}$$

$$\therefore \text{Mass of the reactant} = \text{Mass of the Product} \quad (100 \text{ u/amu})$$

VIII

# Law of Conservation of mass:-

if mass of the reactant = mass of the product.

N = 14; H = 1    Cl = 35.5

Mass of the reactant i.e.  $\text{NH}_3$  &  $\text{HCl}$

$\text{NH}_3$  = Atomic mass of N  $\times$  no. of times it is present + H  $\times$  3

$$\begin{aligned} \text{Mass of } \text{NH}_3 &= 14 \times 1 + 1 \times 3 \\ &= 14 + 3 = 17 \text{ u/amu} \end{aligned}$$

$$\begin{aligned} \text{Mass of } \text{HCl} &= \text{Atomic mass of H} \times \text{no. of times} + \text{Cl} \times 1 \\ &= 1 \times 1 + 35.5 \times 1 \end{aligned}$$

$$= 1 + 35.5$$

$$= 36.5$$

So, Mass of the reactant (i.e.  $\text{NH}_3$  &  $\text{HCl}$ )

$$= \text{Mass of } \text{NH}_3 + \text{Mass of } \text{HCl}.$$

$$= 17 + 36.5$$

$$= 53.5 \text{ u/amu.}$$

Mass of the Product (i.e.  $\text{NH}_4\text{Cl}$ )

$$= \text{N} \times 1 + \text{H} \times 4 + \text{Cl} \times 1$$

$$= 14 \times 1 + 1 \times 4 + 35.5 \times 1$$

$$= 14 + 4 + 35.5 \Rightarrow 53.5 \text{ u/amu.}$$

Mass of the reactant = Mass of the Product (i.e. 53.5 u/amu)  
 $\therefore$  it agrees with the L.O.C of mass.

VIII

## INTERCONVERSION OF MATTER

### INTER MOLECULAR Space

### VIII Importance of Interconversion of matter:-
